

# Trauma Restoration Tips

What and what not to do after a TRAUMA situation when potentially infectious materials are present.

## What to do

- Secure the contaminated area from any further damage.
- Leave air conditioning or heating at 70 degrees unless exposure to the outside prevents this.
- Wear personal protective clothing if you must be in the contaminated area.
- Remove any broken items not affected from the contaminated area once authorities have released the area for clean-up. Be sure to wear heavy gloves in handling broken glass or sharp items.
- Take an inventory of items missing, broken or beyond repair for insurance and/or tax records.
- Inform your insurance agent of the situation as soon as possible.
- If an infectious disease is suspected (Hepatitis or AIDS), wait for further instructions from agent or authorities.
- Call a professional trauma restoration company to assist with returning the contaminated area to normal.

## What to do

- Do not enter the contaminated area unless absolutely necessary.
- Do not risk contact in contaminated area with bare skin. If exposed, wash thoroughly with soap and water. Seek medical attention if an infectious disease is known or suspected.
- Do not touch or move any items until authorities have completed their investigation.
- Do not attempt to clean the contaminated area unless using a proven disinfectant.
